## Wells Clinical Prediction Rule for Deep Venous Thrombosis (DVT)

| Clinical feature                                                        | Points |
|-------------------------------------------------------------------------|--------|
| Active cancer (treatment within 6 months, or palliation)                | 1      |
| Paralysis, paresis, or immobilization of lower extremity                | 1      |
| Bedridden for more than 3 days because of surgery (within 4 weeks)      | 1      |
| Localized tenderness along distribution of deep veins                   | 1      |
| Entire leg swollen                                                      | 1      |
| Unilateral calf swelling of greater than 3 cm (below tibial tuberosity) | 1      |
| Unilateral pitting edema                                                | 1      |
| Collateral superficial veins                                            | 1      |
| Alternative diagnosis as likely as or more likely than DVT              | -2     |
| <b>Total points</b>                                                     |        |

DVT = deep venous thrombosis.

Risk score interpretation (probability of DVT):

- >=3 points: high risk (75%);
- 1 to 2 points: moderate risk (17%);
- <1 point: low risk (3%);

Restraint Required ☐ Yes ☐ No
